

Federizer

Digital Postal System

Abstract

Federizer is a digital postal system. It is a replacement for traditional email system that no longer meets security standards and functional requirements.

Introduction

The main components of the email system as we know it today had been designed between 1971 and 1992 by many inventors. In the course of time, email has become the most commonly used application of the Internet. Nowadays the email infrastructure forms the backbone of the worldwide digital identity, and email is the only truly federated communication system of the Internet.

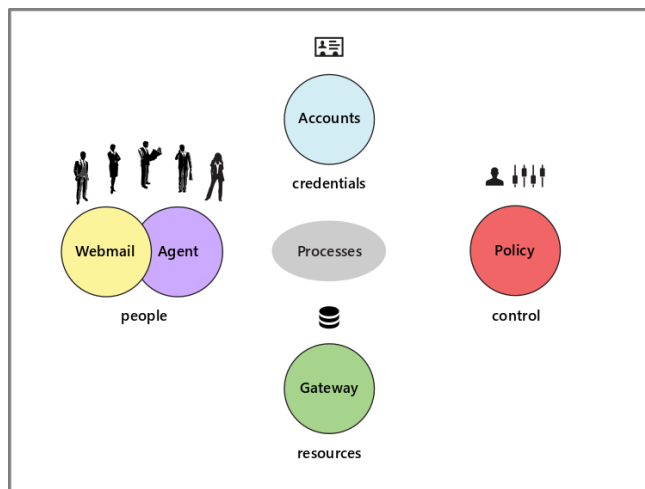

Problem

Despite the rising importance of email infrastructure, the whole ecosystem still relies on over 40 year-old architecture and protocol design. There are spam and attachment issues from the very beginning. Even though the main email system vendors and service providers claim email accounts to be safe, the fact remains that major security and functional flaws are not fixed. The email system becomes an information silo isolated from other systems, making people unable to get things done effectively.

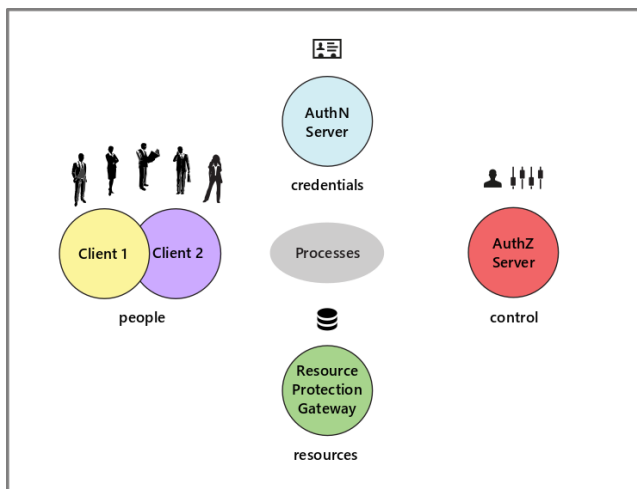

Solution

This concept adopts the Electronic Services approach to meet emerging and future business needs. The design model incorporates Privacy by Design principles to maintain the appropriate level of regulatory compliance. The digital postal system concept is built on top of globally distributed Domain Name System, Web technologies and loosely coupled federated AAA (authentication, authorization, accounting) system layer. The AAA layer is built around OAuth 2.0 specification and includes Resource Protection Gateway in order to control information exchange between security domains. The messages and attachments are stored and transferred separately. Messages are stored in JSON documents and transferred using RESTful web services or gRPC/Protocol Buffers. Attachments are stored on disk or S3 compatible object storage and transferred using HTTP/2 protocol.

Generic Model

OAuth2 Model

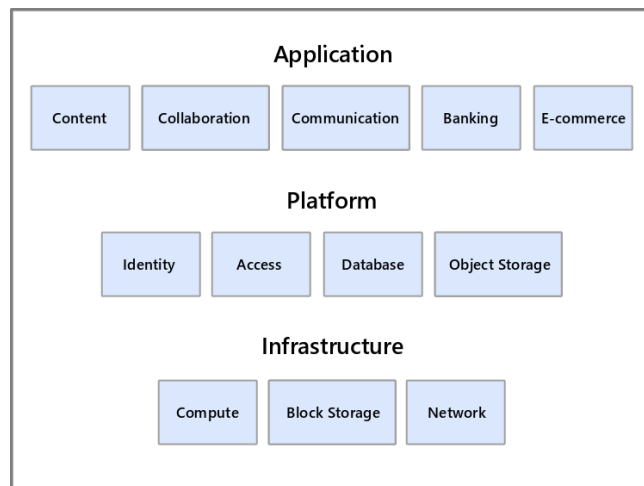

Electronic Services

1. E-mail services in GDPR Article 25 compliance
 - a. No spam - user invitation system guaranties no spam in the Inbox
 - b. Mail tracking & proof of delivery - similar to registered/certified mail with revocable consent
 - c. Reference numbers - channels, threaded conversations
 - d. Time management - calendar, events, to-do, reminders, etc.
 - e. No Internet Message Format/MIME structures - messages are stored in JSON documents
 - f. No attachments size limit - attachments are transferred separately without size limit
 - g. Attachments versioning - attachments with the same content are versioned
 - h. Attachment properties - e.g. invoice due date, total due, variable symbol, status
 - i. Instant messages – deliver messages within seconds
 - j. Instant attachments – download attachments even before they are actually delivered
 - k. Federated workflow - transactions, document/forms automation
 - l. Dynamic and interactive content - e.g. HTML/SVG forms
 - m. Security - easy integration with antivirus and antimalware protection systems
 - n. Privacy - distributed nature of Federizer has intrinsic privacy-preserving properties
2. E-banking services in PSD2 compliance
 - a. Internet payments - make payments directly within the Federizer application
 - b. Multi-bank information - overview of all account information consolidated in one place
3. E-real-time communication services in GDPR Article 25 compliance
 - a. Document collaboration - share document with people and edit it together in real-time
 - b. Video conferencing, direct file transfer, voice, chat - communication in the context of activity
4. E-commerce services, EDI transactions, e-finance, e-government, internet of things ...

Cloud Computing

Federizer is a cloud native system that can be deployed on public, private or hybrid cloud. This allows customers to use all benefits of the cloud technology, to help reduce capital cost (CAPEX -> OPEX), divest infrastructure management and focus on core business.

High-Level Architecture on Cloud

Taxonomy

To highlight the underlying difference between email and Federizer use a new Federizer taxonomy. Endorse the Federizer term.

Top Three Tech Features

1. Transactional semi-structured JSON documents
2. Pulled instant attachments without size limit
3. Loosely coupled federated AAA system layer

Value Proposition

1. Extended Email Services (track & trace, proof of delivery)
2. Content Repository (digital archive, no attachments size limit)
3. Workflow Automation (order fulfillment, approvals, ...)
4. Dynamic & Interactive Content (electronic forms)
5. Security & Privacy (no spam, secrecy of letters)

Credo

Anyone can run its own digital postal system. Digital postal system without borders.

Tagline

Content in the context of activity.

Target Market

According to the 2017 study from the Radicati Group, the number of worldwide email users, including both business and consumer users, will grow from over 3.7 billion in 2017 to over 4.1 billion by 2021. Email use continues to grow in the business world where it is often used not only simply as an interpersonal communication tool, but also as the default choice to send files. That is a lot of B2B and B2C relationships to generate leads to grow the business.

Competitive Trends

Although instant messaging, social networking, chat, and enterprise file sharing and synchronization systems are seeing strong adoption, centralized systems are not very acceptable solutions for B2B and B2C communication. Missing Identity and Access Management integration on both communication sides can lead to potential privacy issues such as leakage of intellectual property or loss of confidential content and makes these systems incompatible with enterprise security policies.

Competitive Advantage

Ease of use - everyone who uses a computer knows how to use email client, there is no need for Federizer users to take a Federizer training course.

Unfair Advantage

A loosely coupled federated AAA system layer specification: Intellectual property rights of the Specification Lead.

Business Model

Federizer is based on open source software:

1. Offer a range of support plans to help organizations use Federizer to deliver a secure and reliable communication service. Pricing is either \$?,000 or \$??,000 per server per year for two different support plans.
2. Offer a paid dedicated support for a fee.
3. There is an opportunity to build a business model on global and/or regional Federizer services à la Gmail.
4. Monetize the platform API (how?)
5. Cloud provider partnerships

Marketing and Sales

Partners, Network effect / Word of mouth.

Cost Structure

Developers, analysts, support ...

Exit

Federizer Foundation - Ecosystem Steering Group / Technical Steering Committee

Conclusion

Federizer can play an important role in communication across various industries in the public and private sectors. The Electronic Services approach predetermine Federizer to become more than a replacement of traditional email system.
